Tomato Color Scheme

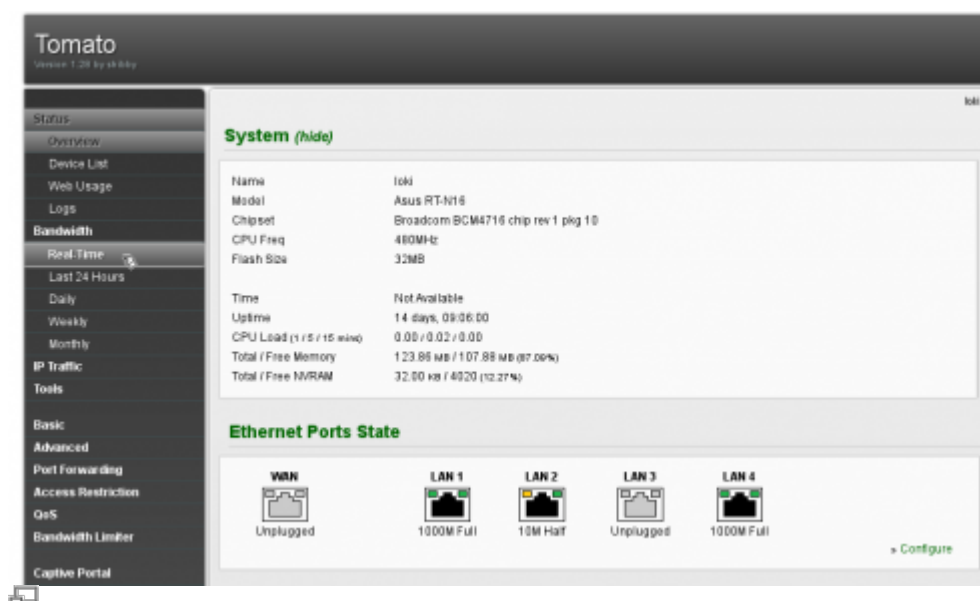

Recently I've updated [Tomato](#) on my Asus RT-N16 and my Netgear WNR3500Lv1 to [Shibbys](#) last version.

Oh ... so enough advertising 😊

I created my own custom.css and now I want to share the result with you.

In administration/admin access you can select an custom.css so I take the "USB Blue - OpenLinksys" css and make some adjustments. The custom.css have to uploaded to /www/ext.

It's certainly not quite finished but for now ... anyone who would use it

my custom.css

Boot save

Laying under /www which is linked below /tmp (/www/ext = /tmp/var/wwwext/ on my router) your custom.css will be lost after reboot. To have the new style also after reboot place the css into the jffs and configure an init script (line ;)) like this

```
ln -s /jffs/custom.css /www/ext/custom.css
```

Download

[custom.css.zip](#)
